Step 1 – Seat Sizes

Seat: - firm seat block provides maximum sensory stimulation, - elongated shape of the seat helps the forward facilitation of the arms. By bracing the arms on the set block an interim impact change for the spine can be achieved, - seat block forces the user into a physiological seating position, - seat block is sloped in the back part in order to slightly tilt the pelvis.

Back: - small and firm iliac crest support with slight lean against the body helps the stabilisation, - iliac spine support and impulse generator are adjustable, - point-shaped impulse transmitters give an orientation for the back position and stimulate the erection and orientation process.

Base frame: - adjustable in height, - lever brake and height adjustment can be operated independently by the user, - therapy chair is tilt resistant, - push bar enables an assistant to also carry the chair.

Areas of application: cerebral apraxia, cognitive processing deficiencies/ ADD, tonus dysregulation deficiencies.
